Science has lost its way, at a big cost to humanity

Researchers are rewarded for splashy findings, not for double-checking accuracy. So many scientists looking for cures to diseases have been building on ideas that aren't even true.

Reproducibility

Marcia McNutt

► Marcia McNutt is editor-in-chief of *Science*.

Science advances on a foundation of trusted data. But a recent study found that the scientific community was shaken by reports that a troubling number of studies were irreproducible. For example, in one new meta-analysis, researchers found that only 11 percent of drug development studies fit one of the top recommendations of the U.S. National Institute of General Medical Sciences' "Guidelines for Increasing Transparency." Authors will indicate handling (such as how to deal with outliers), whether they used a sufficient signal-to-noise ratio, whether the experimenter was blind to the conduct of the experiments, and whether the results were statistically significant.

Too many sloppy mistakes are creeping into scientific papers. Lab heads must look more rigorously at the data — and at themselves.

SCIENTIFIC MISCONDUCT ? WHAT ARE THE CONSEQUENCES ?

The Duke University scandal with scientific misconduct on lung cancer

- *Nature Medicine* - 12, (2006) Genomic signatures to guide the use of **chemotherapeutics**, by Anil Potti and 16 other researchers from Duke and USF
- Major commercial labs licensed it and were about to start using it before two statisticians discovered and publicized its faults

Dr. Baggerly and Dr. Coombes found errors almost immediately. Some seemed careless — moving a row or a column over by one in a giant spreadsheet — while others seemed inexplicable. The Duke team shrugged them off as “clerical errors.”

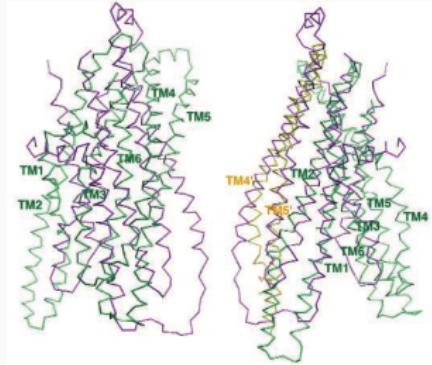

The Duke researchers continued to publish papers on their genomic signatures in prestigious journals. Meanwhile, they started three trials using the work to decide which drugs to give patients.

- Retractions: January 2011. **Ten papers that Potti coauthored in prestigious journals were retracted for varying reasons**

Bad science is deleterious

- It is used to backup stupid politics, it affects people's life, ...
- It blurs the frontier between scientists and crooks

UNFORTUNATE MISTAKES

Geoffrey Chang (Scripps, UCSD) works on crystallography and studies the structure of cell membrane proteins.

He specialized in structures of **multidrug resistant transporter proteins in bacteria**: MsbA de Escherichia Choli (Science, 2001), Vibrio cholera (Mol. Biology, 2003), Salmonella typhimurium (Science, 2005)

2006: Inconsistencies reveal a programming mistake

a homemade data-analysis program had flipped two columns of data, inverting the electron-density map from which his team had derived the protein structure.

TOOL 1: COMPUTATIONAL NOTEBOOKS/LITTERATE PROGRAMMING

Un document computationnel

Mon ordinateur m'indique que π vaut approximativement

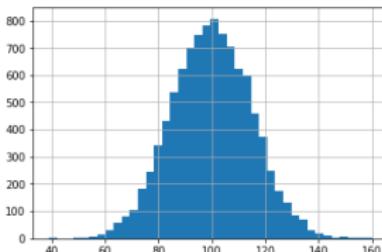

3.141592653589793

Mais calculé avec la méthode des [aiguilles de Buffon](#), on obtiendrait comme approximation :

```
import numpy as np
N = 1000000
x = np.random.uniform(size=N, low=0, high=1)
theta = np.random.uniform(size=N, low=0, high=pi/2)
2/(sum((x+np.sin(theta))>1)/N)
```

3.1437198694098765

On peut inclure des formules mathématiques comme $\frac{1}{\sigma\sqrt{2\pi}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)$ et des dessins qui n'ont rien à voir avec π (si ce n'est une constante de normalisation... ☺).

TOOL 1: COMPUTATIONAL NOTEBOOKS/LITTERATE PROGRAMMING

Document initial dans son environnement

The screenshot shows a Jupyter Notebook interface with three code cells:

- In [1]:** `# Un document computationnel`
Mon ordinateur m'indique que π vaut "approximativement"
- In [1]:** `from math import *`
print(pi)
3.141592653589793
- In [2]:** Mais calculé avec la [méthode des aiguilles de Buffon](https://fr.wikipedia.org/wiki/Aiguille_de_Buffon) (https://fr.wikipedia.org/wiki/Aiguille_de_Buffon), on obtient d'autant comme approximation :
- In [2]:** `import numpy as np`
`N = 1000000`
`x = np.random.uniform(size=N, low=0, high=1)`
`theta = np.random.uniform(size=N, low=0, high=np.pi/2)`
`2/(sum((x+np.sin(theta))>1))/N`
Out [2]: 3.14371986944998765
- In [3]:** On peut inclure des formules mathématiques comme $\sqrt{2/\pi} \exp(-x^2/2)$ et des dessins qui n'ont rien à voir avec π (si ce n'est une constante de normalisation...).
- In [3]:** `%matplotlib inline`
`import matplotlib.pyplot as plt`
`mu, sigma = 100, 15`
`x = mu + sigma*np.random.randn(10000)`
`plt.hist(x,40)`
`plt.grid(True)`
`plt.show()`

The final output is a histogram of 10000 random numbers, centered at 100 with a standard deviation of 15, showing a symmetric bell-shaped curve.

Document final

Un document computationnel

Mon ordinateur m'indique que π vaut approximativement

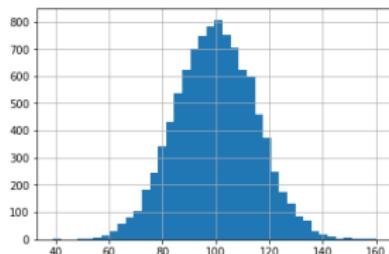

3.141592653589793

Mais calculé avec la [méthode des aiguilles de Buffon](#), on obtiendrait comme approximation :

CHANGING RESEARCH PRACTICES

Soft. Engineering, Statistics, and Reproducible Research in the curricula

- Book on RR *Vers une recherche reproductible: Faire évoluer ses pratiques*
- MOOC on RR (3rd edition Feb. 2020)
- A new "Advanced RR" MOOC (Oct. 2020)
 - Software environment control (Docker)
 - Scientific workflow (snakemake)
 - Managing data (HDF5, archiving)

Manifesto: "I solemnly pledge" (WSSSPE, Lorena Barba, FAIR)

1. I will teach my graduate students about reproducibility
2. All our research code (and writing) is under version control
3. We will always carry out verification and validation
4. We will share data, plotting script & figure under CC-BY
5. We will upload the preprint to arXiv at the time of submission of a paper
6. We will release code at the time of submission of a paper
7. We will add a "Reproducibility" declaration at the end of each paper
8. I will keep an up-to-date web presence

CHANGING PUBLISHING PRACTICES

Artifact evaluation and ACM badges

Major conferences

- Supercomputing: Artifact Description (AD) **mandatory**, Artifact Evaluation (AE) still **optional**, Double blind vs. RR
- NeurIPS, ICLR: **open reviews**, reproducibility challenge

Joelle Pineau @ NeurIPS'18

- ACM SIGMOD 2015-2019, Most Reproducible Paper Award...

Mentalities are evolving people care, make stuff available, errors are found and fixed

REPRODUCIBLE RESEARCH = RIGOR AND TRANSPARENCY

To err is human: RR will not prevent errors nor fraud. It will help though

Good research requires time and resources

1. Train yourself and your students: RR, statistics, experiments
 - Beware of checklists and norms
 - Understand what's at stake
2. Change the norm: make publication practices evolve
3. Incentive: consider RR/open science when hiring/promoting

PERSPECTIVES AND OPPORTUNITIES

Transparency is not new. Interoperability and Reusability is newer

- This leads to fast and tremendous progress (e.g., Deep Learning)
- How Reusable is really Data and Software ?
 - Often specific, often impossible to customize despite openness
- Need for better *norms* ... but beware of brutal transitions
 - Acknowledge different kind of contributions (novelty vs. quality)
 - Independent experts and certification agencies
 - In the meantime, embrace uncertainty

PERSPECTIVES AND OPPORTUNITIES

Transparency is not new. Interoperability and Reusability is newer

- This leads to fast and tremendous progress (e.g., Deep Learning)
- How Reusable is really Data and Software ?
 - Often specific, often impossible to customize despite openness
- Need for better *norms* ... but beware of brutal transitions
 - Acknowledge different kind of contributions (novelty vs. quality)
 - Independent experts and certification agencies
 - In the meantime, embrace uncertainty

Lack of reproducibility is mostly linked to statistics and computers

- Computer Science has no well-defined empirical practices yet
 - What can we expect from an experiment in terms of precision/representativeness/perenniality ?
- Prepare the Future: Toward literate experimentation?
 - Reuse, reuse, reuse!
 - Shared and controled testbeds (e.g., Grid'5000/SILECS)
 - How to share Experiments ?
